

# Instructions to run Celebrity Stalker

To run our web application, node.js needs to be installed and you have to be connected to the internet. The following middleware also needs to be installed using the “npm install ...”-command:

- express
- express3-handlebars
- passport
- passport-local
- sqlite3
- body-parser
- cookie-parser
- express-session

A map containing all of the modules is also present along with the code, so this can be used instead of downloading all of the middleware. We also included a CSdatabase.db-file with some users and markers present, so testing is easier. Otherwise the application will just make a new .db-file in the same folder as main.js.

After this, the application is all set to run, just enter the command “node main.js” in the terminal and the application will start on address <http://127.0.0.1:3000>.
